

Entity-Relationship Diagram

Newspaper

Design an entity / relationship diagram for a newspaper that wants to build its database. Take into account the following:

- We have two types of users, one for the publishers and one for the readers. We also have two different types of readers: subscribers and non-subscribers.
- From the publishers we have the full name, username, password, date of creation of the account and categories of news in which that publisher is working on.
- Each publisher is going to publish news. For each one of them, we will have the title, date of creation, category, body, images and whether is only for subscribers or not.
- Our news can be commented by the readers. These comments are enumerated for each news.
- From the readers we only store the username, password and creation date of the account. Each comment has a body, title and creation date.
- Every new is going to be associated with at least one of the categories mentioned before.
- Finally, our subscribers will pay their monthly subscription at a flat price of 5€. We have stored the information of every month paid by the subscribers (month and year).

IMPORTANT: When prerequisites are not enough, you can make the assumptions you believe necessary for the model proposed.
